

Styracis plicata

STYRACIS PLICATA

Styracis plicata, a species of the genus Styracis, is a tree of the family Styracaceae, native to the southeastern United States. It is a large, spreading tree, reaching a height of 100 feet or more. The bark is thick and deeply furrowed, and the wood is hard and heavy. The leaves are alternate, ovate, and have a serrated margin. The flowers are small and are borne in clusters. The fruit is a winged seed pod, which is flattened and has a long, thin wing. The tree is a common sight in the southern United States, and it is often used for lumber. The wood is used for a variety of purposes, including the manufacture of furniture, millwork, and other wood products. The tree is also a source of resin, which is used in the manufacture of varnishes and other products. The tree is a member of the genus Styracis, which is named in honor of the Greek physician, Styrax. The species name, plicata, refers to the furrowed bark of the tree.
